

Laboratory Activity No. 8

Converting TUI to GUI Programs

Course Code: CPE103	Program: BSCPE
Course Title: Object-Oriented Programming	Date Performed: 3/15/25
Section: 1-A	Date Submitted: 3/16/25
Name: Villanueva, Bryan O.	Instructor: Engr. Maria Rizette H. Sayo.
1. Objective(s):	
This activity aims to convert a TUI program to GUI program with the Pycharm framework	
2. Intended Learning Outcomes (ILOs):	
The students should be able to: 2.1 Identify the main components in a GUI Application 2.2 Create a simple GUI Application that converts TUI program to GUI program	
3. Discussion:	
In general, programs consist of three components—input, processing, and output. In TUI programs, input is usually obtained from an input statement or by importing data from a file. Output is usually given by a print statement or stored in a file. When we convert a TUI program to a GUI program, we replace input and print statements with Label/Entry pairs. Processing data and inputting and outputting data to files works much the same in both types of programs. The primary difference is that the processing in GUI programs is usually triggered by an event	
4. Materials and Equipment:	
Desktop Computer with Anaconda Python or Pycharm Windows Operating System	
5. Procedure:	
PLEASE REFER TO THIS LINK FOR ALL MY ANSWERS https://github.com/Bryan-Villanueva/CPE-103-OOP-1-A/tree/main/WEEK%208	

1. Type these codes in Pycharm:

```
#TUI Form
def main():
    # Find the largest number among three numbers
    L = []
    num1 = eval(input("Enter the first number:"))
    L.append(num1)
    num2 = eval(input("Enter the second number:"))
    L.append(num2)
    num3 = eval(input("Enter the third number:"))
    L.append(num3)
    print("The largest number among the three is:",str(max(L)))
main()
```

2. Run the program and observe the output.

Figure 1. TUI form

Figure 1(a) TUI form with three input numbers

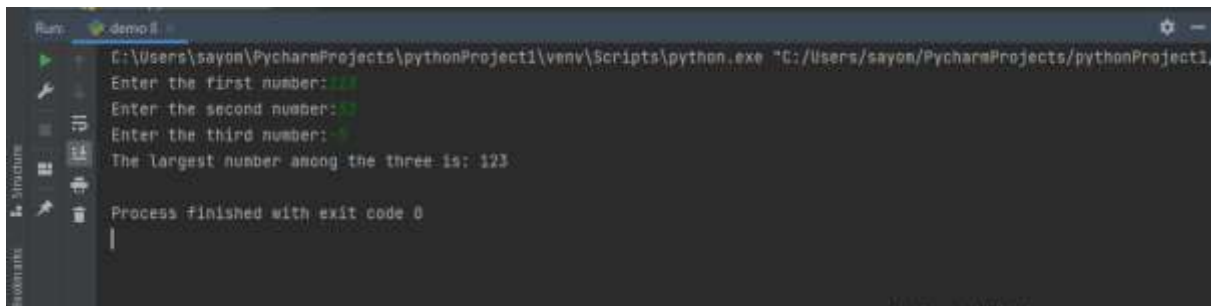

Figure 1(b) TUI form with output "The largest number among the three"

Method 1 above shows a TUI program and a possible output in Figures 1(a) and (b) while Figure 2 shows the output of the GUI program in Method 2.

5. Procedure:

Method 2

```
from tkinter import *
```

```
window = Tk()
```

```
window.title("Find the largest number")
```

```
window.geometry("400x300+20+10")
```

```
def findLargest():
```

```
    L = []
```

```
    L.append(eval(conOfent2.get()))
```

```
    L.append(eval(conOfent3.get()))
```

```
    L.append(eval(conOfent4.get()))
```

```
    conOfLargest.set(max(L))
```

```
lbl1 = Label(window, text = "The Program that Finds the Largest Number")
```

```
lbl1.grid(row=0, column=1, columnspan=2,sticky=EW)
```

```
lbl2 = Label(window,text = "Enter the first number:")
```

```
lbl2.grid(row=1, column = 0,sticky=W)
```

```
conOfent2 = StringVar()
```

```
ent2 = Entry(window,bd=3,textvariable=conOfent2)
```

```
ent2.grid(row=1, column = 1)
```

```
lbl3 = Label(window,text = "Enter the second number:")
```

```
lbl3.grid(row=2, column=0)
```

```
conOfent3=StringVar()
```

```
ent3 = Entry(window,bd=3,textvariable=conOfent3)
```

```
ent3.grid(row=2,column=1)
```

```
lbl4 = Label(window,text="Enter the third number:")
```

```
lbl4.grid(row=3,column =0, sticky=W)
```

```
conOfent4 = StringVar()
```

```
ent4 = Entry(window,bd=3,textvariable=conOfent4)
```

```
ent4.grid(row=3, column=1)
```

```
btn1 = Button(window,text = "Find the largest no.",command=findLargest)
btn1.grid(row=4, column = 1)
lbl5 = Label(window,text="The largest number:")
lbl5.grid(row=5,column=0,sticky=W)
conOfLargest = StringVar()
ent5 = Entry(window,bd=3,state="readonly",textvariable=conOfLargest)
ent5.grid(row=5,column=1)

mainloop()
```

Results 2

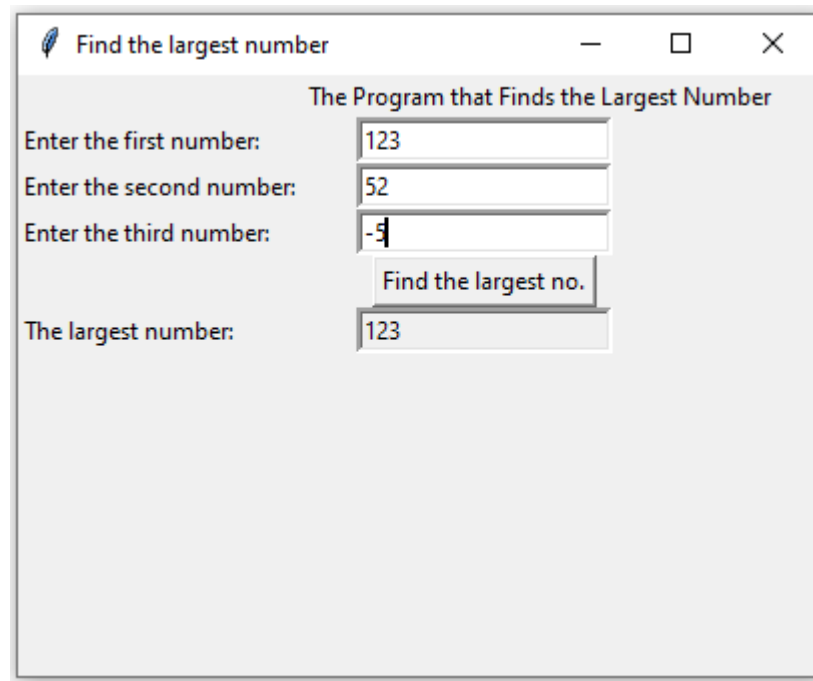

Figure 2. GUI program to find the largest number

Questions

1. What is TUI in Python?

TUI is a type of interface that uses text and simple graphics like menus and buttons made of text to interact with the user. It runs in the terminal or command line.

2. How to make a TUI in Python?

You can use libraries like `curses`, `urwid`, or `textual` to create a TUI in Python. These help you design text-based menus, buttons, and other interactive elements.

3. What is the difference between TUI and GUI?

TUI uses only text and simple symbols in the terminal. GUI uses windows, icons, and buttons with images and colors. TUI is simpler and works in a terminal, while GUI needs a graphical display.

6. Supplementary Activity:

TUI Implementation
Simple TUI Calculator

```
def add(a, b):  
    return a + b
```

```
def subtract(a, b):  
    return a - b
```

```
def multiply(a, b):  
    return a * b
```

```
def divide(a, b):  
    if b != 0:  
        return a / b  
    else:  
        return "Error! Division by zero."
```

```
def main():  
    print("Simple Calculator")  
    print("Options:")  
    print("1. Add")  
    print("2. Subtract")  
    print("3. Multiply")  
    print("4. Divide")
```

```
choice = input("Select operation (1/2/3/4): ")
```

```
num1 = float(input("Enter first number: "))  
num2 = float(input("Enter second number: "))
```

```
if choice == '1':  
    print(f"{num1} + {num2} = {add(num1, num2)}")  
elif choice == '2':  
    print(f"{num1} - {num2} = {subtract(num1, num2)}")  
elif choice == '3':  
    print(f"{num1} * {num2} = {multiply(num1, num2)}")  
elif choice == '4':
```

```
        print(f"{num1} / {num2} = {divide(num1, num2)}")
    else:
        print("Invalid input.")

if __name__ == "__main__":
    main()
```

GUI Conversion of the Calculator:
import tkinter as tk

Functions for calculation

```
def add():
    result.set(float(entry1.get()) + float(entry2.get()))
```

```
def subtract():
    result.set(float(entry1.get()) - float(entry2.get()))
```

```
def multiply():
    result.set(float(entry1.get()) * float(entry2.get()))
```

```
def divide():
    try:
        result.set(float(entry1.get()) / float(entry2.get()))
    except ZeroDivisionError:
        result.set("Error! Division by zero.")
```

Create the main window

```
root = tk.Tk()
root.title("Simple Calculator")
```

Create StringVar to hold the result

```
result = tk.StringVar()
```

Create the layout

```
tk.Label(root, text="Enter first number:").grid(row=0, column=0)
entry1 = tk.Entry(root)
entry1.grid(row=0, column=1)
```

```
tk.Label(root, text="Enter second number:").grid(row=1, column=0)
entry2 = tk.Entry(root)
entry2.grid(row=1, column=1)
```

Buttons for operations

```
tk.Button(root, text="Add", command=add).grid(row=2, column=0)
tk.Button(root, text="Subtract", command=subtract).grid(row=2, column=1)
tk.Button(root, text="Multiply", command=multiply).grid(row=3, column=0)
tk.Button(root, text="Divide", command=divide).grid(row=3, column=1)
```

Label to show result

```
tk.Label(root, text="Result:").grid(row=4, column=0)
result_label = tk.Label(root, textvariable=result)
result_label.grid(row=4, column=1)
```

Start the main loop

```
root.mainloop()
```

Once you've successfully created the GUI version of the calculator, try adding the following features to enhance the program:

1. **Clear Button:** Add a button to clear the input fields and reset the result.
2. **History Feature:** Add a list or label to show the history of operations performed.
3. **Advanced Operations:** Implement additional operations such as square roots, powers, or trigonometric functions.
4. **Input Validation:** Add validation to ensure that the user only enters numeric values in the input fields.
5. **Styling:** Experiment with different styles (font sizes, button colors) to improve the appearance of the GUI.

6. Conclusion

Through this activity, I successfully converted a text based (TUI) program into a graphical (GUI) application using PyCharm. I learned how to identify and work with basic GUI components like buttons, windows, and input fields. By comparing the TUI and GUI versions, I now better understand the differences between terminal and graphical interfaces. This hands on experience helped me develop practical skills in building more interactive and user friendly programs. The activity achieved its goal of strengthening my ability to design and implement simple GUI applications.
